A study was made of the polymerization of epichloro-
hydrin by a number of ionic catalytic systems. It is
shown that the FeCl_3 -propylene oxide "complex"
catalyst can be used to produce polyepichlorohydrin
of regular structure in good yield. The principal

Trans. of *Optika i Spektroskopiya (USSR) 1960, v. 9, no. 6, p. 784-786.

Observations were made of the radiation of a discharge of helium and neon excited by a powerful super high frequency (SHF) impulse in a narrow gap placed across a coaxial line. By means of spectrum photography, with the help of visual observations and the photoelectric method, 16 lines of HeI and 24 lines of NeI were found in the red part of the spectrum. Ionic lines were not discovered in either gas. The intensity of the helium and neon lines follows almost exactly the amplitude changes of the SHF signal for helium to pressures of 10 mm mercury and for neon at pressures lower than (Physics--Electronics, TT, v. 5, no. 12) (over)
